## Recap of 1 wave mechanics

- The wave function contains all information we can know about a system.
- Born's interpretation:  $|\Psi(x,t)|^2$  is the probability density
- $\Psi(x,t)$  are continuous and square integrable
- Discontinuous potentials

$$-\frac{\hbar^2}{2m} \left[ \frac{d\Psi(x)}{dx} \Big|_{x=e} - \frac{d\Psi(x)}{dx} \Big|_{x=-e} \right] + \int_{-e}^e (V(x) - E)\Psi(x) dx$$

For finite discontinuity  $\frac{d\Psi}{dx}$  is continuous.

$$\rightarrow \text{T.I.S.E} \left[ i\hbar \frac{d}{dt} \Psi(x,t) = \hat{H} \Psi(x,t) \right]$$

- Stationary states: If  $\frac{\partial}{\partial t} |\Psi(x,t)|^2 = 0$
- Boundary values cause quantization.

- It is only possible for a state to be eigenfunction of both A and B if  $[A, B]\Psi = 0$

## 1-D problems

→ Bound states are discrete and non degenerate.

Proof: Let  $\Psi_1$  and  $\Psi_2$  are degenerate.

$$\begin{aligned} -\frac{\hbar^2}{2m} \frac{d^2\Psi_1}{dx^2} + V\Psi_1 &= E\Psi_1 \\ -\frac{\hbar^2}{2m} \frac{d^2\Psi_2}{dx^2} + V\Psi_2 &= E\Psi_2 \end{aligned}$$

$\Psi_1 \frac{d\Psi_2}{dx} - \Psi_2 \frac{d\Psi_1}{dx} = 0$

$$\Psi_1 \frac{d\Psi_2}{dx} - \Psi_2 \frac{d\Psi_1}{dx} = C \quad \leftarrow \frac{d}{dx} \left( \Psi_1 \frac{d\Psi_1}{dx} - \Psi_2 \frac{d\Psi_2}{dx} \right) = 0$$

$$\Rightarrow \Psi_1 = e^{\frac{d}{dx}x} \Psi_2 \quad (\text{disintegration constant})$$

$|x| \rightarrow \infty \Rightarrow C=0$

$\boxed{\text{Same system}}$

→ Eigen functions of  $\hat{H}$  can always be chosen pure real.

Hint:  $\Psi_2 = \frac{\Psi_1 + \Psi_1^*}{2}$  is also an eigenfunction.  
 (true for higher dimensions also)

→ The wave function  $\Psi_n(x)$  in  $\boxed{1d}$  has  $n$  nodes

if  $n=0$  is considered as ground state.

3

Bound state

If

 $V_{\min}$ 

$$E < \min(V(+\infty), V(-\infty))$$

Unbound states cannot be normalised and they have continuous states.

→ For symmetric potentials, the wave  $\psi(x)$  is either even or odd

Proof:  $\hat{P} \psi(\vec{r}, t) = \psi(-\vec{r}, t)$  (parity operator)

Operation is even if

$$\hat{P} \hat{A} \hat{P} = \hat{A}$$

odd if  $\hat{P} \hat{B} \hat{P} = -\hat{B}$

$$\Rightarrow \hat{A} \hat{P} = (\hat{P} \hat{A} \hat{P}) \hat{P} = \hat{P} \hat{A} \hat{P}^2 = \hat{P} \hat{A}$$

Similarly

$$\hat{B} \hat{P} = -\hat{P} \hat{B}$$

⇒ Even operator commute with P. So, both have same eigen functions.

Some Problems

1) Free particle.

$$-\frac{\hbar^2}{2m} \frac{d^2\psi}{dx^2} = E\psi$$

For hamiltonian eigenfunctions let  $k = \sqrt{\frac{2mE}{\hbar^2}}$

$$\Rightarrow \psi(x, t) = A e^{ik(x - \frac{\hbar k}{2m} t)} + B e^{-ik(x + \frac{\hbar k}{2m} t)}$$

→ It is not normalizable. H eigen states may not be bound states.

4

Wave packet: A localized wave function.

$$\boxed{\text{I.F.T}} \leftarrow \Psi(x, t) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \phi(k) e^{i(kx - \omega t)} dk$$

near  $x=0$  constructive  
amplitude of wave packet

$$\boxed{\text{F.T}} \leftarrow \phi(k) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \psi(x_0) e^{-ikx} dx$$

near  $x=0$ , constructive interference.

$$\int_{-\infty}^{\infty} |\psi_0(x)|^2 dx = \int_{-\infty}^{\infty} |\phi(k)|^2 dk$$

$$\int_{-\infty}^{\infty} e^{-x^2} dx = \sqrt{\pi}$$

$$\int_{-\infty}^{\infty} \frac{e^{-\frac{1}{2}(\frac{x-\mu}{\sigma})^2}}{\sigma \sqrt{2\pi}} = 1$$

For gaussian wave packets

$$\Delta x \Delta k = \frac{1}{2} \quad \text{or} \quad \Delta x \Delta p = \frac{\hbar}{2}$$

\* In general

$$\Delta x \Delta k \geq \frac{1}{2} \quad \Delta x \Delta p \geq \frac{\hbar}{2}$$

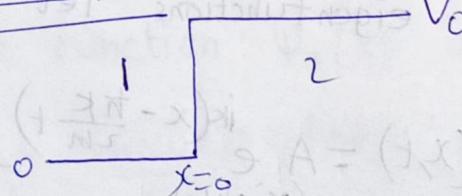

$$V_{ph} = \frac{\omega(k)}{k}$$

$$V_g = \frac{dw(k)}{dk}$$

$$\dot{V}_g = V_{ph} - 2 \frac{dV_{ph}}{dx}$$

classical analogue

## 2) Potential Step

a) Case  $E > V_0$

$$\psi_1(x) = Ae^{ik_1 x} + Be^{-ik_1 x}$$

$$\psi_2(x) = Ce^{ik_2 x} + De^{-ik_2 x}$$

$$D=0, \quad B = \frac{K_1 - K_2}{K_1 + K_2} A, \quad C = \frac{2K_1}{K_1 + K_2} A$$

$$R = \frac{|B|^2}{|A|^2}$$

$$T = \frac{K_2}{K_1} \frac{|C|^2}{|A|^2}$$

$$R+T=1$$

$$b) E < V_0$$

$$\Psi(x,t) = \begin{cases} A e^{i(K_1 x - \omega t)} + B e^{-i(K_1 x + \omega t)} & x < 0 \\ C e^{-K_1' x} e^{-i\omega t} & x \geq 0 \end{cases}$$

$$B = \left( \frac{K_1 - iK_1'}{K_1 + iK_1'} \right) A \quad C = \left( \frac{2K_1}{K_1 + iK_1'} \right) A$$

$$R = 1$$

$$T = \text{undefined}$$

### 3) Infinite square well

$$V(x) = 0 \text{ if } 0 \leq x \leq a, \quad \infty \text{ otherwise}$$

$$E_n = \frac{\hbar^2 \pi^2 n^2}{2ma^2}$$

$$\Psi_n(x) = \sqrt{\frac{2}{a}} \sin\left(\frac{n\pi}{a}x\right)$$

Zero point energy  $\Rightarrow E_1 > 0$

### 4) Finite square well

$$V(x) = \begin{cases} -V_0 & -a \leq x \leq a \\ 0 & |x| > a \end{cases}$$

Bound states ( $E < 0$ )

$$\text{even} \rightarrow \Psi(x) = \begin{cases} F e^{-Kx} & x > a \\ D \cos(kx) & 0 < x < a \\ \Psi(-x) & x < 0 \end{cases}$$

## 6) Finite square well

$$V(x) = \begin{cases} V_0 & x < -\frac{a}{2} \\ 0 & -\frac{a}{2} \leq x \leq \frac{a}{2} \\ V_0 & x > \frac{a}{2} \end{cases}$$

$$k_1 = \sqrt{\frac{2m(V_0 - E)}{\hbar^2}}$$

$$k_2 = \sqrt{\frac{2mE}{\hbar^2}}$$

Bound states ( $0 < E < V_0$ )

odd or antisym

$$\Psi_a(x) = \begin{cases} Ae^{k_1 x} & x < -\frac{a}{2} \\ C \sin(k_2 x) & -\frac{a}{2} \leq x \leq \frac{a}{2} \\ Pe^{-k_1 x} & x > \frac{a}{2} \end{cases}$$

$$\Psi_s(x) = \begin{cases} Ae^{k_1 x} & x < -\frac{a}{2} \\ B \cos(k_2 x) & -\frac{a}{2} \leq x \leq \frac{a}{2} \\ De^{-k_1 x} & x > \frac{a}{2} \end{cases}$$

For  $\Psi_a$ , bound energies are given by

$$k_2 \cot\left(\frac{k_2 a}{2}\right) = -k_1$$

For  $\Psi_s$

$$k_2 \tan\left(\frac{k_2 a}{2}\right) = k_1$$

then number of bound states  $\rightarrow \infty$ .  
Infinite square well.

$\rightarrow$  If  $V_0 \rightarrow \infty$  approximately

always atleast one bound

$\rightarrow$  Even if  $V_0 \rightarrow 0$ , state exists.

$$(E > V_0) \quad V(x) = -V_0$$

$$-a \leq x \leq a$$

$$k = \sqrt{\frac{2mE}{\hbar^2}}$$

$$\Psi(x) = A e^{ikx} + B e^{-ikx} \quad x < -a$$

$$= C \sin(kx) + D \cos(kx) \quad -a < x < a$$

$$F e^{ikx} \quad x > a$$

$$F = \frac{e^{-2ik a} A}{\cos(2ka) - i \frac{(E+V_0)}{2\hbar^2} \sin(2ka)}$$

$$T = \frac{|F|^2}{|A|^2}$$

$$= \frac{1}{1 + \frac{V_0^2}{4E(E+V_0)} \sin^2\left(\frac{2a}{\hbar} \sqrt{2m(E+V_0)}\right)}$$

Perfect transmission  $\rightarrow$

$$E_n + V_0 = \frac{\hbar^2 \pi^2 \hbar^2}{2m(2a)^2}$$

### 5) Barrier

$$V(x) = \begin{cases} 0 & x < 0 \\ V_0 & 0 \leq x \leq a \\ 0 & x > a \end{cases}$$

$$E > V_0 \quad \Psi(x) = \begin{cases} Ae^{ik_1 x} + Be^{-ik_1 x} & x \leq 0 \\ Ce^{ik_2 x} + De^{-ik_2 x} & 0 < x < a \\ Ee^{ik_1 x} & x \geq a \end{cases}$$

$k_1 = \sqrt{\frac{2mE}{\hbar^2}}$   
 $k_2 = \sqrt{\frac{2m(E-V_0)}{\hbar^2}}$

$$T = \frac{k_1 |E|^2}{k_1 |A|^2} = \left[ 1 + \frac{V_0^2}{4E(E-V_0)} \sin^2(a \sqrt{\frac{2mV_0}{\hbar^2}} \sqrt{\frac{E}{V_0} - 1}) \right]$$

$$T = \left[ 1 + \frac{1}{4E(E-1)} \sin^2(2\sqrt{E-1}) \right]^{-1} \Leftrightarrow \frac{1}{1 + \frac{V_0^2}{4E(E-V_0)} \sin^2(a \sqrt{\frac{2mV_0}{\hbar^2}} \sqrt{\frac{E}{V_0} - 1})}$$

$$A_n = \frac{1}{\sqrt{n!}}$$

Analytic
